Add to List

Share

A password is said to be **strong** if it satisfies all the following criteria:

- It has at least 8 characters.
- It contains at least **one lowercase** letter.
- It contains at least **one uppercase** letter.
- It contains at least **one digit**.
- It contains at least **one special character**. The special characters are the characters in the following string: "!@#\$%^&*()-+\" .
- It does **not** contain 2 of the same character in adjacent positions (i.e., "aab" violates this condition, but "aba" does not).

Given a string password, return true if it is a **strong** password. Otherwise, return false .

Example 1:

Input: password = "IloveLe3tcode!"
Output: true
Explanation: The password meets all the requirements. Therefore, we return true.

Example 2:

Input: password = "Me+You--IsMyDream"
Output: false
Explanation: The password does not contain a digit and also contains 2 of the same character in adjacent positions. Therefore, we return false.

Example 3:

Input: password = "1aB!"
Output: false
Explanation: The password does not meet the length requirement. Therefore, we return false.

Constraints:

- 1 <= password.length <= 100
- password consists of letters, digits, and special characters: "!@#\$%^&*()-+\" .
